

NATTAWAT CHOOJIRAWONG

Senior Full-Stack & AI Engineer | Production LLM Systems (Agents · Tool Calling) | Cloud-Native AWS

Bangkok, Thailand · min.nattawat@gmail.com · linkedin.com/in/minnattawat · github.com/minnat

Open to remote roles and international relocation · Thai (native), English (fluent)

SUMMARY

Senior full-stack engineer with **15 years** shipping production software end to end — most of it **delivering client projects at a US product consultancy**, from requirements through build, deployment, and ownership in production, plus a live platform architected and built solo. Recent deep focus on **LLM-powered systems** (agent/tool-calling architectures, structured extraction, guardrails, human-in-the-loop review). Co-built **Paydrop**, a crypto payments platform **acquired by Cornerstone Global Management (2022)**; delivered **Thailand's first SEC-approved ICO portal**, presenting to and iterating directly with the regulator; later led 11 engineers at a crypto-custody company. Works AI-natively: uses Claude Code and agentic tooling to move fast while owning correctness and security.

SELECTED AI & PRODUCT WORK

Independent Product · Solo Engineer — whereto.party · Live event-discovery platform 2026 – Present

- Launched the public product solo — **first commit to live in just over two weeks** — and have shipped continuously since: event listings across multiple cities, with sole ownership of frontend, backend, integrations, infrastructure and deployment, as well as the product and design decisions.
- Shipped an **LLM extraction feature**: paste an Instagram link and the event form arrives prefilled. Claude returns schema-validated data for a person to review, with defenses against prompt injection and hallucinated values — a bad model response yields an empty form, never a bad listing.
- Built an autonomous **content-supply pipeline** (GitHub Actions, every 12h) crawling an Instagram account graph: LLM triage and post classification, country-balanced scheduling so one high-yield region can't monopolize the crawl, and severity-weighted rejection feedback that down-ranks poor sources — with a **mandatory human review queue** before anything publishes.
- Secured the platform **without user accounts**: posters manage their events through an emailed link, admins sign in with role-based access, and automated jobs authenticate separately — with database-level rules and strict API responses keeping private data out of public views. **700+ tests**.

AI Investor Assistant — private-markets case study · Assessed at 90%+ by a London private-markets firm 2026

- Timeboxed prototype: a personalized assistant answering investors' portfolio questions, built so **the LLM never does arithmetic** — deterministic, unit-tested tools compute every figure, per-investor isolation is enforced in code rather than by prompt, and every answer exposes its raw tool output.

WORK EXPERIENCE

Senior Full-Stack Engineer · Iterate — product consultancy, Santa Monica, CA (remote) Dec 2023 – Present

- **Re-engaged to build Valinity V2** — second generation of the Ethereum DeFi protocol first delivered in 2022, a decentralized asset manager and collateral-lending system: implemented the client's protocol design and **owned the technical architecture** — UUPS upgradeability, OpenZeppelin access-control and reentrancy patterns, a workaround for Solidity's stack-depth limit, and the test strategy.
- For a US job-marketplace client: rebuilt the job-ingestion system for **multi-gigabyte XML/CSV feeds from 30+ sources** — implementing much of a staged extract → shape → persist pipeline (S3 chunking, per-source normalization, Redis-cached location matching, batched writes) that ran **400%+ faster** and let every source refresh daily without timeouts.
- Delivered its **monetization stack**: Stripe customer portal and onboarding, QuickBooks/Stripe invoicing, CPC/CPA pricing, and campaign budgeting.
- Owned its **Customer.io integration**: tracked job-seeker activity — searches, job views, applications — and synced accounts with new activity into Customer.io to drive personalized job recommendations, plus a batched job that emailed users a digest when they had new recommendations and hadn't been contacted recently.
- Built out its **partner-facing API**, the intake path for job clicks and applications from distribution partners: **HMAC-signed requests** with per-partner API keys, extracted into a **standalone service** with its own deployment and split into queue and process stages over **SQS** — so intake stays up even when the database or core app is down.

Engineering Team Lead · Atato — Singapore (remote)

May 2022 – Jun 2023

- Led engineering delivery for **Atato Custody**, an institutional digital-asset custody platform built on **multi-party computation (MPC)**: no single private key exists — transactions are authorized by a quorum of key shares, with customer-configurable policy rules governing what each transaction requires based on amount, asset, destination and other conditions. Multi-chain across Bitcoin and EVM networks.
- Grew the team from **5 to 11 engineers** across backend, frontend, mobile and QA; joined hands-on and moved into technical leadership as the team scaled, running Agile/Scrum delivery and reporting directly to the CTO.
- Cut release cycle time from months to **3 weeks**; led weekly technical-design reviews across the team that reduced development time and aligned product and business stakeholders.
- Earlier, in the company's blockchain-consultancy phase: co-built the ICO-portal prototype in a **three-engineer team** and worked directly with the **Thai SEC** — presenting, educating the regulator, and incorporating required changes — culminating in **Thailand's first ICO Portal approval**.

Full-Stack Engineer · Iterate — product consultancy, Santa Monica, CA (remote)

Jun 2011 – Apr 2022

- Progressed from feature work to **owning client projects end to end** — later delivering up to 90% of a build solo, or owning the full backend/API consumed by separate frontend and mobile teams.
- Co-built **Paydrop**, a cryptocurrency payments and payroll platform for freelancers and small businesses, with the consultancy's founder — from working prototype through launch to **acquisition by Cornerstone Global Management**.
- Enabled **Sharge Thailand's** (leading Thai EV-charging network) first **OCPP support**: single-handedly built and deployed the WebSocket service connecting backend systems to EV chargers — embedded with the client, picking up OCPP, WebSockets and the EV domain from zero; still running across the network nationwide.
- Built **Valinity V1** (2022), the first generation of the DeFi protocol, as the closing project of this tenure.
- Delivered **10+ client products from requirements to deployed MVP** across fintech, mobility, marketplaces and Web3 — repeatedly starting cold in an unfamiliar domain and owning the build end to end.
- Mentored and trained colleagues to self-sufficiency across multiple project teams.

SKILLS

AI / LLM: Anthropic Claude API, agent/tool-calling architectures, structured extraction (Zod-validated), prompt-injection defense, guardrail & human-in-the-loop design, Claude Code / AI-native development workflow

Languages & Frameworks: Python (Flask), TypeScript/Node.js (Express, NestJS), Solidity (Hardhat), Next.js/React, SQL

Cloud & Delivery: AWS (S3, SES, SQS, Lambda, EC2, CloudFormation, CodeDeploy, CloudFront), infrastructure as code, Docker, Kubernetes, GitHub Actions, CI/CD pipelines, Cloudflare, Vercel

Architecture & Data: System design, data modeling, technical design review, REST APIs, microservices, event-driven and queue-based systems (SQS), OAuth 2.0, JWT and session/token authentication, PostgreSQL (row-level security, role-based access control), SQLAlchemy, Redis, MongoDB, Supabase

Web3 / Fintech: DeFi protocol architecture, UUPS upgradeable contracts, OpenZeppelin, Uniswap integration, Stripe billing and invoicing integrations, regulated-product delivery (Thai SEC), KYC/AML-adjacent workflows, security-first engineering (allowlists, fail-closed patterns, audits)

EDUCATION

B.Eng., Information and Communication Engineering · Chulalongkorn University, Bangkok

2007 – 2011
